Product Safety Information

Intended Use:
These air starters are intended for use in starting reciprocating internal combustion engines. These starters are designed to be operated from a remote location after proper installation on the engine requiring starting.

For additional information refer to Air Starters for Internal Combustion Engines Product Safety Information Manual Form 45558624. Manuals can be downloaded from www.irtools.com.

The Ingersoll Rand Starter is a precision piece of equipment intended to give efficient, economical performance over a long period of time. However, as with any product, performance, economy and durability are determined for the most part by a few simple common sense procedures that can be recommended only by the manufacturer and adhered to only by the customer.

The recommendations outlined in this manual are based on over 30 years of experience in the air and gas starter field. Study these recommendations and follow them. They can save you considerable time and expense. This manual should be filed in a permanently available location.

The Ingersoll Rand Starter is a precision piece of equipment intended to give efficient, economical performance over a long period of time. However, as with any product, performance, economy and durability are determined for the most part by a few simple common sense procedures that can be recommended only by the manufacturer and adhered to only by the customer.

Either one of two lubrication systems is recommended. For typical Starter installations where the cranking cycle is less than 10 seconds, we recommend an Ingersoll Rand No. HDL2 Lubricator installed as shown on Page 3. Use either diesel fuel or 10W non detergent motor oil for lubricant. If the cranking cycle is more than 10 seconds, we recommend the Ingersoll Rand Lubricator No. NL-24-8 installed in the main air supply line. Use a good quality 10W non detergent oil and adjust the Lubricator to flow 1 to 2 drops per second.

Lubrication

Do not lubricate starters with flammable or volatile liquids such as kerosene or jet fuel.

For temperatures above 32° F (0°C), use a good quality SAE 10 non detergent motor oil.

For temperatures below 32° F (0°C), use diesel fuel. We cannot too strongly emphasize the importance of proper lubrication of the Starter. It is the prime requisite for top performance and maximum durability, yet requires so little time there is really no excuse for disregarding it.

Either one of two lubrication systems is recommended. For typical Starter installations where the cranking cycle is less than 10 seconds, we recommend an Ingersoll Rand No. HDL2 Lubricator installed as shown on Page 3. Use either diesel fuel or 10W non detergent motor oil for lubricant. If the cranking cycle is more than 10 seconds, we recommend the Ingersoll Rand Lubricator No. NL-24-8 installed in the main air supply line. Use a good quality 10W non detergent oil and adjust the Lubricator to flow 1 to 2 drops per second.

Either one of two lubrication systems is recommended. For typical Starter installations where the cranking cycle is less than 10 seconds, we recommend an Ingersoll Rand No. HDL2 Lubricator installed as shown on Page 3. Use either diesel fuel or 10W non detergent motor oil for lubricant. If the cranking cycle is more than 10 seconds, we recommend the Ingersoll Rand Lubricator No. NL-24-8 installed in the main air supply line. Use a good quality 10W non detergent oil and adjust the Lubricator to flow 1 to 2 drops per second.

Installation

General Information

1. Always make certain your Air Starter is properly installed. A little extra time and effort spent in doing a top quality job will contribute considerably toward a reliable starting system that does a superior job of starting your engine quickly under all conditions.

2. We strongly recommend that on all vehicular installations, and on stationary engines subject to vibration, you use hoses of the specified diameter instead of rigid pipe connections. Vehicle and engine vibration will soon loosen rigid pipe connections, whereas hoses will absorb the vibration, and connections will remain tight.

3. In the actual mounting of an Air Starter, it is best to have the hose connections already made at the receiver, and to have the Starter end of the hose handy for attaching to the Starter. Wherever possible-and many times it is necessary attach the air hoses to the Starter before mounting the Starter on the flywheel housing. The reason for following this procedure is twofold:

   a. After mounting the Starter, it is often impossible to make hose connections due to space limitations.

   b. Once the hoses are attached, they carry some of the weight of the Starter and make it easier to complete the mounting.

4. The efficiency of an Air Starter can be greatly impaired by an improper hook-up. Hoses smaller than those recommended will reduce the volume of air to the motor, and the use of reducers in the exhaust port will restrict the exhaust and choke the motor. The number of tees and elbows, and the length of the supply line should be kept to a minimum, For SS175, use 1” hose or pipe for supply lines up to 30 feet long; use 1-1/4” hose or pipe if the supply line is over 30 feet long. For SS550, use 1 -1/4” hose or pipe for supply lines up to 30 feet long; use 1-1/2” hose or pipe if the supply line is over 30 feet long.

5. A leak in any of the connections means that the system will drain overnight and will have to be repressurized the next morning by use of another vehicle or compressor. Make your connections right the first time to avoid unnecessary costs and delays. On all threaded connections throughout the system, use Ingersoll Rand No. SM8-441 Sealant, non-hardening No. 2 Permatex or Loctite* Pipe Sealant. Teflon tape is not recommended. Always run your air supply line from the side or top of the receiver never at or near the bottom. Moisture in the air collects at the bottom of the receiver and could cause corrosion in the starter motor or, worse yet, freeze solid in cold weather so that the Starter would be inoperative. After all connections have been made, check each joint with a soap bubble test. There must be no leaks. The slightest leak will cause the system to lose pressure overnight.

6. We recommend installation of a “glad hand” for emergency repressurizing of the system. To keep the “glad hand” clean and free of dirt, and to protect it from distortion, a second “glad hand” closed by a pipe plug can be mated to it, or a glad hand protector bracket can be used.

7. Always mount the Air Starter so that the exhaust port is downward. This will help prevent any accumulation of water in the starter motor.

Orientation of the Air Starter

If the factory orientation will not fit your engine due to radial location of the drive housing, or location of the inlet and/ or exhaust ports, reorient the Starter as follows:

1. Look at the proper outline drawing on Page 4 or 5 and note that the drive housing can be located in any one of eight radial positions relative to the exhaust. The air inlet (motor housing cover) can be located in any one of four radial positions relative to the exhaust port.

2. Study the engine mounting requirements, and determine the required orientation of the drive housing relative to the exhaust port. The exhaust port should be aimed downward when installed on the engine. If the drive housing has to be reoriented, remove the four drive housing cap screws and rotate the drive housing to the required position.

Do not separate the drive housing from the gear case.

Reinstall the drive housing cap screws and alternately tighten them to 20 ft-lb (27 Nm) of torque.

3. Now that you have the drive housing properly oriented relative to the exhaust port, notice whether or not the inlet port will be favourably located for hose installation. If this must be reoriented, remove the four motor housing cover cap screws, and rotate the motor housing cover to its desired position. Reinstall the motor housing cover cap screws and alternately tighten them to 20 ft-lb (27 Nm) of torque.

There are eight holes through the motor housing cover, four of which are not used and are plugged. If the orientation requires that the plugged holes be used to accommodate the housing cover cap screws, use a flatend drift to carefully drive the plugs inward. Then reinstall them in the other four holes.
Mounting the Air Starter
1. Study the piping diagrams on page 6. We strongly recommend that the Starter be connected exactly as shown.
2. The air receiver tank for a Starter installation must have a working pressure capability equal to or greater than the maximum pressure at which the Starter will be operated.
3. If you are going to connect to a receiver tank that is already in service, bleed off the air pressure in the tank.

**NOTICE**
Bleed off the air pressure through a valve or pet cock. Do not remove a plug from the tank while the tank is still pressurized. Drain off any water that may have accumulated in the bottom of the tank.
4. Using a 1” or 1-1/4” short nipple, install the SRV100 or SRV125 Starter Relay Valve on the end of the receiver tank as shown in the piping diagram.

**NOTICE**
Make certain the connection is made to the inlet side of the Relay Valve indicated by the word “IN” cast on the valve body.
5. Install the No. SMB-618 Starter Control Valve on the dash panel (for vehicular installations) or some other appropriate panel (for stationary installations).
6. Attach No. TA-STR-100 Starter Instruction Label to the control panel adjacent to the Starter Control Valve Solenoid.
7. Mount the No. 150BMP-1064 Air Pressure Gauge on or adjacent to the control panel. It should be located where it is readily visible to the operator of the Control Valve.
8. Connect the Starter Control Valve to the Relay Valve live air port with 1/4” hose. Install a Tee in this line with a short feeder hose to the Pressure Gauge.

**NOTICE**
Make certain that the hose is connected to the “SUP” side of the Starter Control Valve.
9. Measure the distance from the Relay Valve on the receiver to the starter location on the engine to determine the exact length of 1-1/4” or 1” air hose required.
10. Attach the air hose to the outlet side of the Relay Valve, and run the hose through the frame, etc. to its final position at the starter location.
11. At this point, determine whether or not it is feasible or practical to attach the hose to the Starter before or after the Starter is actually mounted. In many cases, it may be necessary to attach the hose to the Starter before mounting.
12. Liberally grease the teeth on the pinion and ring gear with a good, sticky gear grease. This will help promote the life of the ring gear and the drive pinion.
13. Mount the Starter on the flywheel housing. Tighten the mounting bolts as follows:
   a. For 5/8” bolt, 90 ft-lb (122 Nm) of torque
   b. For 3/8” bolt, 30 ft-lb (41 Nm) of torque
14. Install a 1-1/4” hose line from the “DEL” side of the Starter Control Valve to the “IN” port on the Starter Drive Housing.
15. Install a 1/4” hose line from the “OUT” port on the Starter Drive Housing to the small pipe tapped port on top of the Starter Relay Valve.
16. On air-operated Starters, install a Muffler or Road Splash Deflector in the exhaust port of the Starter. Use No. 150BMA674 Muffler or No. SS175-A735 Road Splash Deflector on SS175 Starters. Use No. SS350-A674 Muffler or No. SS350-A735 Road Splash Deflector on SS350 Starters.

**WARNING**
If the Starter is gas operated, the exhaust must be piped away to a location where it will not be ignited or inhaled.
17. Mount an HDL2 Lubricator on or near-the Starter as described under “Installation of HDL2 Lubricator”.
18. Pressurize the complete starting system and check every connection with a soap bubble test. There must be no leaks.

**Installation of HDL2 Lubricator**

**Mounted on Starter**

**Mounted at Remote Location**

The HDL2 Lubricator is self-priming and may be installed directly on the Starter or remotely located. Although the Lubricator is capable of drawing lubricant from a source 4 ft (1.2 m) lower than the point of installation, we recommend the lubricating oil lines be as short as practical. We recommend using the unpressurized fuel return line as the source of lubricant. However, oil may be supplied from a separate reservoir or the diesel fuel tank. When the diesel fuel tank is the lubricant source, install a 10 micron to 50 micron fuel filter (Part No. HDL1-47) in the oil supply line at the fuel tank. The lubricant line should be teed into the fuel return line with the leg of the tee going to the lubricator directed in the down direction to insure that the lubricator does not draw air instead of oil.

**Mount the HDL2 Lubricator as follows:**
1. If you are going to mount the HDL2 Lubricator on the Starter, remove one of the 3/8” pipe plugs from the Motor Housing Cover on the Starter, and replace it with the HDL2. If you are going to mount the HDL2 at a remote location, use two U-bolts and base clamp available for the Lubricator.
2. If you mounted the HDL2 at a remote location, install a 1/4” hose from the end of the Lubricator having both a male and female thread to one of the 3/8” pipe tapped holes on the Starter Motor Housing Cover.
3. Install a No. 6 hose from the 1/8” NPT oil inlet in the side of the HDL2 to the unpressurized fuel line, diesel fuel tank or separate oil reservoir. Tighten the fitting at the Lubricator to 15 to 36 ft-lb (20.3 to 48.8 Nm) torque. Important: This connection must be vacuum tight. The thread on the fitting must be clean; assemble it without sealing compound or Teflon® tape.

**Note:** Before initial operation, manually fill the oil supply line.
4. If a separate lubrication reservoir is used, fill it with diesel fuel or an SAE 10 or 10W light, non detergent motor oil.

* Registered trademark of E. I. DuPont.
Series SS175 with Flange Mounting

Lubricator Connection both Sides.

Notes:
1. Starter should be installed on the engine with the exhaust pointed down.
2. Use the set of control ports on the upper side of the drive housing (only drive housings with two sets of control ports).
3. These models are not approved for applications where the starter is exposed to the transmission fluid.
4. Drive housing orientation code is based on position of mounting hole opposite the pinion opening.
5. Standard orientation shown (02H) on SAE3 & (02J) on SAE1 will be shipped unless otherwise specified.
6. Please read the instructions before attempting to reorient.
7. Starter weight = 13 kg (29 lbs).

Piping Diagram

Typical Vehicular Installation:

1¼" or 1" Nipple

SRV12ST Relay Valve

NOTE: Use IR SMB-441 Sealant On All Pipe Connections.

Typical Stationary Installation:

Air Strainer 20BM-A267AT

For gas operation, exhaust must be connected to a safe area. For air, use SS175-A735 Road Splash Deflector or 150BM-A674 Muffler on SS175 models. Use SS350-A735 Road Splash Deflector or SS350 A674 Mufflers on SS350 models.

一般信息
1. 确保正确安装气动起动器。花费少量额外时间和精力完成出色工作将可造就一个可靠的起动系统，而该系统可在所有情况下快速起动发动机。
2. 我们强烈建议在受到振动的所有车载装置和固定发动机上，您可使用直径的软管而非刚性连接管。车辆和发动机振动会很快松动刚性管连结，而软管会缓冲此振动，从而使连结保持紧固。
3. 在实际安装气动起动器的过程中，最好已在接收器中连接软管，并使软管的起动器末端便于连接到起动器。在飞轮外壳上安装起动器之前，很多时候都需要在可行之处将空气软管连接到起动器。对于为何要遵循该步骤，有以下两个方面的原因：在安装起动器之后，常常因空间限制而无法连接软管。在连接软管之后，它们会支撑起动器的部分重量，以便更加容易完成安装。
4. 连接不当会大大削减气动起动器的效率。使用小于所建议尺寸的软管将会导致进入到马达中的压缩空气量不足，而且使用排气管端口中的渐缩管将可以限制排气，同时会堵塞马达。在SS175，如果供应管线长达30英尺，可使用1“软管或管道；如果供应管线超过30英尺，可使用1-1/4”软管或管道。对于SS350，如果供应管线长达30英尺，可使用1-1/4”软管或管道；如果供应管线超过30英尺，可使用1-1/2”软管或管道。
5. 任何连接装置出现泄漏状况都表明，系统将会整夜排放并必须在第二天早上通过使用另一台车辆或压缩机来增压。第一次要正确连接以避免不必要的费用和延迟。在整个系统的所有螺纹连接装置上，使用Ingersoll Rand No. SMB-441 Sealant，非硬化No. 2 Permatex或Loctite®管道密封剂。建议不要使用特氟隆胶带。务必从接收器的侧面或顶部运行空气供应管线，切勿在底部或底部附近运行。空气中的水分聚集在接收器底部，便可能会腐蚀起动器电动机或在寒冷天气下凝结成固体(更为糟糕的情况)且无法使用。在进行所有连接后，可使用肥皂气泡测试检查每个接头。确保不会出现渗漏状况。稍有泄漏便会导致系统很快失压。
6. 对于系统的紧急增压，我们建议使用“glad hand”安装。要保持“glad hand”干净和没有污物，以及避免变形，可将其连接到由管道塞子密封的第二个“glad hand”，或可使用“glad hand”保护器托架。
7. 总是安装气动起动器以便排气管端口朝下。这将有助于预防起动器电动机中出现水份积聚现象。

气动起动器的定向
1. 如工厂动向因传输箱的径向位置或进气口和/或排气管端口而无法安装发动机，请按照如下方式重新定向：
2. 如确定发动机安装要求，并确认与排气管端口相对的传动箱的需重新定向。当在发动机上安装时，排气管端口应向下。如果传动箱镇重新定向，则可断开4个传动箱有头螺丝，然后将传动箱旋转至所需位置。重新安装传动箱有头螺丝，并交替地将其旋紧至20英尺-磅（27牛米）扭矩。
3. 切勿分开传动箱和齿轮箱。

手动安全信息
用途：此类空气启动器应用于往复式内燃机的启动。此类启动器应在正确安装到需要启动的内燃机上后，进行远程操作。更多信息请参见内燃机空气启动器产品安全信息手册表45558624。

Ingersoll Rand 起动器是一种精密装置，可长时间提供高效和经济性能。但是，如同任何产品一样，性能、经济性和耐用性大多都是由少数简单的常识步骤确定，只能由制造商建议，并仅由客户遵守。本手册中概述的建议根据30多年以来在空气和气动起动器领域总结的经验。学习和采纳这些建议。它们可让您节省大量时间和费用。本手册应存放在固定位置。

润滑
不要使用汽油或喷气机燃油等易燃、易挥发的液体来润滑气动起动器。

警告
- 若温度高于32° F (0° C)，可使用优质SAE 10非去垢性机油。
- 若温度低于32° F (0° C)，可使用柴油。我们不会过度强调正确润滑气动器的重要性，这对达到最高性能和最大耐用性至关重要，然而所需温度如此之低以致没有理由不对其予以处理。

安装气动起动器
1. 学习第6页上的管道布置图。我们强烈建议按如图所示的方式准确连接起动器。
2. 起动器装置的空气储气罐必须具有工作压力性能（等于或大于起动器将会操作的最大压力）。
3. 如果要连接到正在工作的储气罐，可排出箱中的气压。通过阀或旋塞排出气压。当储气罐仍处于增压状态时，切勿从罐上拔下塞子。排出积聚在罐底部的水份。
4. 使用1”或1-1/4”的短螺纹接套将SRV100或SRV125起动器主启动阀安装在接收箱末端，如管道布置图所示。确保将软管连接到起动器控制阀的“SUP”一侧。
5. 测量储气罐的主启动阀和发动机的起动器位置之间的距离以确定所需的1-1/4”或1-1/2”软管的正确长度。
6. 将起动软管连接到主启动阀的出口侧，并使用短软管将此管道中的三通管安装到压力表上。确保将软管连接到起动器控制阀的“SUP”一侧。

产品安全信息
用途：此类空气启动器应用于往复式内燃机的启动。此类启动器应在正确安装到需要启动的内燃机上后，进行远程操作。更多信息请参见内燃机空气启动器产品安全信息手册表45558624。

手册可从www.irtools.com下载。
11. 在此, 可在实际安装起动器之前或之后, 确定将软管连接到起动器是否可行或实用。在多数情况下, 可能需要在安装之前将软管连接到起动器。

12. 请在开启之前将软管连接到起动器。通常情况下，可能需要在安装之前将软管连接到起动器。

13. 请使用优质粘性齿轮润滑油来充分润滑小齿轮和环形齿轮上的齿轮。这将有助于延长环形齿轮和传动小齿轮的寿命。

14. 将起动器安装在飞轮外壳上。按以下方式旋紧装配螺栓:
   a. 对于 5/8”螺栓，扭矩是 英尺-磅 (122 纳米)
   b. 对于 3/8”螺栓，扭矩是 30 英尺-磅 (41 纳米)

15. 在开启前的端口和起动器传动箱上的“IN”端口之间安装 1/4”软管管线。

16. 在起动器传动箱的“OUT”端口和起动器继动阀顶端的小管道分接部分之间安装 1/4”软管管线。

17. 在气动起动器上，请在起动器的排气管端口中安装消音器或公路防溅导向板。使用 SS175 起动器上的 No. 150MA674 消音器，或 No. SS175-A735 公路防溅导向板。使用 SS350 起动器上的 No. SS350-A674 消音器，或 No. SS350-A735 公路防溅导向板。

18. 如果以气动方式操作起动器, 必须将废气排至无法燃烧或吸入的地方。

19. 根据“安装 HDL2 润滑器”说明，将 HDL2 润滑器安装在起动器上或起动器附近。

20. 如果在远程位置安装了 HDL2，便可在具有外螺纹和内螺纹的润滑器末端和起动器电动机外壳盖上的 3/8”管道分接孔之间安装 1/4”软管。

21. 请在 HDL2 侧的 1/8”NPTF 油进口到非增压燃油管线、柴油箱或单独油箱之间安装 6 号软管。将润滑器的装置旋紧至 15 至 36 英寸-磅 (20.3 至 48.8 纳米) 扭矩。重要信息：该连接必须是真空密封。装置的螺纹必须清洁。不可使用密封剂或 Teflon® 胶带安装。

22. 在首次操作之前，可手动将油注入供油管线中。

23. 如果使用单独润滑剂储存罐，可向其中注入柴油或 SAE 10 或 10W 轻质非去垢剂型机油。

* E. I. Dupont 的注册商标。
图示 SS350 (带法兰装置)

1. 行程控制气口
2. SAE 3 法兰
3. SAE 1 导向
4. SAE 3 导向

注意：
1. 应该使用气口与发动机上安装起动器。
2. 使用表中列出的控制气口位置。
3. 这些型号不能用于制气口漏在行程波浪中的情况。
4. 传动箱足部注释在图中显示的示意方向进行说明。
5. 请在添加辅助装置前阅读说明。
6. 请根据使用条件和使用条件进行修改。
7. 起动器管 13 千瓦（29 马力）

製品に関する安全性

これらのエアスターターは、往復内燃機関の始動に使用することを目的としています。これらのエンジンスターターは、始動させる必要のある往復内燃機関に正しく取り付けられ、離れた場所から操作するように設計されています。

詳細は、内燃機関用エアスターター製品安全情報説明書45558624を参照してください。
www.irools.comから説明書をダウンロードすることができます。

Ingersoll Rand

始動装置は、長期に渡って効率のよいか、経済的な性能を示すことを目的とした精密機器です。しかし、どの製品もそうであるように、性能、経済性および耐久性は、大半が、製造者によってのみ推奨でき、顧客によってのみ支持できる2-3の単純な常識的な手順によって決定されます。

この取扱説明書で概説されている推奨内容は、空気およびガスの始動装置の分野に於ける30年以上に渡る経験に基づいています。これららの推奨内容を検討し、従ってください。これらの推奨内容によって時間と費用の節約が可能になります。この取扱説明書は、永久に利用できる場所にファイルしてくいでしょう。

潤滑

始動装置の潤滑には、人工またはジェット燃料のような可燃性または揮発性液体を使用しないでください。

1. 温度が32°F(0°C)以下の場合、高品質のSAE10非洗浄性モーターオイルを使用します。
2. 温度が32°F(0°C)以上の場合、ディーゼル燃料を使用します。始動装置の適切な潤滑の重要性は、どれほど強調しても強調し過ぎることはありません。適切な潤滑は、最高の性能および最大の耐久性の第一要件であり、しかもほとんどの時間を必要としないのでこれを軽視する理由はありません。

再組付け

一般情報

1. ご使用の空気始動装置が正しく再組立てられているか常に確認します。最高品質の仕事の実行に費やした僅な、余分な時間および努力は、ご使用のエンジンをすべての条件下で素早く始動させるという優れた仕事を実行する、信頼できる始動システムにかなり貢献します。
2. すべての車両への再組付けおよび振動に晒される固定エンジンについて、配管による固定した接続を行うのでなく、規定の口径のホースを使用することを強く推奨します。車両およびエンジンの振動により固定した接続は直ぐ緩みますが、ホースの場合、振動を吸収し、接続は強固なままです。
3. 空気始動装置を実際に取り付ける場合は、ホースは前で受け手側での接続を済ませ、ホースの始動装置側の端は、始動装置に取り付けられるように近くに置いておくのが一番良い方法です。可能な場合、また必要なときは何度も、始動装置をフライホイール筐体に取り付ける前に空気ホースを始動装置に取り付けます。この手順に従う理由は、二つあります。
   a. 始動装置を取り付けた後、ホースの接続は、スペースの制限からしばしば不可能となります。
   b. ホースは一旦取り付けられると、始動装置の重量の何割かを支え、取り付けを更に容易にします。
4. (空気始動装置) の効率は、不適切な接続によって非常に損なわれることがあります。推奨したものよりも小さいホースをご使用になれた場合、モーターへの空気量は、減少し、排気ポートに減速機を使用した場合、排気を制限し、モーターを動かすが、力が降ります。接続の短い状態、ゼネラルサイクルが6秒以下の典型的な始動装置再組付けの場合、Ingersoll Rand No. SMB-441シールド非硬化剤No.2 PermatexまたはLoctite®パイプシーラントを使用します。テフロンテープは推奨しません。
5. どかの接続部に漏れがあるということは、システムが一晩中空気を流出しているということであり、翌日の日、別の人車またはコンプレッサを使用して再度圧力を上げる必要があります。接続部を始端から確認してみないでください。不要なコストや遅れの発生を避けます。システム全体のすべてのネジ接続は、Ingersoll Rand No.SMB-441シールド非硬化剤No.2 PermatexまたはLocitite®パイプシーラントを使用します。テフロンテープは推奨しません。

2種類の潤滑システムのどちらも推奨します。クラウンケースクイックが10秒以下の典型的な始動装置再組付けの場合、Ingersoll Rand No. HDL2 Lubricatorをページ3に示されるように再組付けすることを推奨します。潤滑油には、ディーゼル燃料または10W非洗浄性モーターオイルを使用します。クラウンケースクイックが10秒を超える場合、Ingersoll Rand Lubricator No.NL-24-8を主要給気ラインに再組付けすることを推奨します。良質の10W非洗浄性オイルを使用してLubricatorの流速を毎秒1-2滴に調整します。

空気始動装置の向き

工場で設定された向きが出すが、駆動装置の放射状配置または吸気/排気ポートの配置のためにご使用のエンジンに合わない場合、以下のように始動装置の向きを変えてもいきます。
1. ページ4または5にある適切な外形寸法図をご覧になり、駆動部筐体が排気管に対し、8箇所の放射状位置のどの位置に配置できることにご注目ください。吸気口(モーター筐体カバー)は、排気ポートに対し4箇所の放射状配置のどの位置に配置できます。
2. エンジンの取り付け要求を検討し、排気ポートに対する駆動部筐体の必要な向きを決定します。排気ポートは、エンジンに再組付けをすると、下向きにしてください。駆動装置筐体の向きを変え必要がある場合、4の駆動装置筐体キャップネジを外し、駆動装置筐体を要求される位置に回転させます。

備考

駆動装置筐体を変速装置から分離させないでください。駆動装置筐体キャップネジ元のようご再組付けてください。20 ft-lb(27 Nm)のトルクで交互に締め付けます。

03532561_en6
3. これで、駆動筐体を排気ポートに対し、正しい向きにできたので、吸気ポートをホースの再組付けに対して紳士の配慮を払拭しているか注意します。これで向きを変える場合、4 本のモーター筐体カンプネジを外し、モーター筐体カンプネジを希望の位置に回転させます。駆動部筐体カンプネジを元のように再組み付け、20 ft-lb (27 Nm) のトルクで交互に締め付けます。

モーター筐体カンプネジは4箇所の穴があり、使用しないものは栓をし、向きによって、栓をした穴がモーター筐体カンプネジの収納に使用することに必要になった場合、水平面のスキージ間を使用して慎重に栓を押し込みます。それから、駆動部筐体カンプネジを元のように再組付けます。

空気始動装置の取り付け

1. ページ 6 の配管図を検討します。始動装置が表示された通り正しく接続されることを強く推奨します。

2. 始動装置上に接続用の空気受動タンクは、始動装置が運転されている最大圧力以上動作圧力を有する必要があろう。

3. 既に使用中の受動タンクに接続する場合には、受動タンクの空気圧を徐々に減らして無くします。タンク内の空気をバルブまたはコックを通して徐々に減らして無くす。それから、始動装置に付けることのない3箇所の穴に元のように再組付けます。

 Bulg本体に刻印された "IN (入) " という用語で表示された "レーバルブ" の吸気側に接続されることを確認します。

5. ダッシュバネル（車両再組付け用）または他の適切なバネル（固定再組付け用）に、No. SMB-618 始動装置制御バルブを再組付けます。

6. [始動装置制御バルブ レノイド] に従接する制御バネルに、No. TA-STR-100 始動装置制御バルブを再組付けます。

7. No. 150MP-1064 風圧計に制御バネルまたはその周囲に取り付けます。風圧計は、[制御バルブ] の運転員が容易に見ることができるように配置してください。

9. 受動器への[レーバルブ] からエンジン上の始動装置の位置までの距離を測定し、必要とすると1/4インチまたは1インチの空気ホースの正確な長さを決定します。

10. [レーバルブ] の排気側に空気ホースを取り付け、このホースをフレームなどを通じて、始動装置のある場所の最終位置まで敷きます。

11. この時点で、始動装置を実際に取り付ける前にまたは後に、ホースを始動装置に付けがくすることが可能または実際、またはそうではないかもしれません。そうであれば、その場合には、始動装置を取り付ける前に、ホースを始動装置に付けることが必要である場合があります。

12. ピニオンおよびリングギアの歯の清掃およびリングギアのクリーンさを十分に付けてください。これを付けることは、リングギアおよび駆動ピニオンの寿命を延長するのに役立ちます。

13. 始動装置をフライホイール筐体上に取り付けます。取り付けポルトを以下のよう下に締め付けます。
   a. 5/8 インチ・ポルトに対しては90 ft-lb (122 Nm) のトルク
   b. 3/8 インチ・ポルトに対しては30 ft-lb (41 Nm) のトルク

14. [始動装置制御バルブ] の "DEL " 側から [始動装置駆動筐体] 上の "IN " 側に1/4インチ・ホースラインを再組付けします。

15. 1/4インチ・ホースラインを [始動装置ドライブ筐体] 上の "OUT " ポートから [始動装置レーバルブ] の上端の小管のタップ付きポートに再組付けします。

警告

始動装置がガス操作式の場合、排気は、配管によって発火または吸入の生じない場所に排出する必要があります。

17. [HDL2 ループライケア] の再組付けの下に説明されているように、始動装置上またはその周囲に [HDL2 ループライケア] を取り付けます。始動システム全体に圧力を加え、すべての接続部をせっけん泡試験でチェックします。漏れの無いことが必須です。

HDL2 ループライケアの再組付け

始動装置上への取り付け

再組付け時の油付箇所

HDL2 ループライケアは自給式で、始動装置上に直接再組付けすることが可能です。ループライケアは、再組付け位置から4 ft (12m) 低い供給源から潤滑油をくみ上げることができますが、潤滑油ラインを実用的な程度に短くするこことは推奨します。油の供給源として圧力が加わっていない燃料戻りラインを使用されることを推奨します。しかし、油は、別の容器またはディーゼル燃料タンクから供給することもあります。ディーゼル燃料タンクが潤滑油供給源であるときは、10 ～ 50 ミクロンの燃料フィルター（部品No. HDL1-47）を燃料タンクの油供給ラインに再組付けします。潤滑油ラインは、T型分歧で燃料戻りラインに組込まれるようにして、T型分歧の脚が下向きにループライケアに向かって、ループライケアが油の代わりに空気を取り込むことのないことを保証することを推奨します。
HDL2 ルブリケータを以下のように取り付けます。

1. HDL2 ルブリケータを始動装置に取り付ける場合、始動装置上の [モーター筐体カバー] から 3/8 インチパイプ栓を外して HDL2 と取り替えます。HDL2 を離れた位置に取り付ける場合、[ルブリケータ] に使用できる 2 本の U ボルトおよび基礎取付金具を使用します。

2. HDL2 を離れた位置に取り付けた場合、雄ネジ、雌ネジの両方を有するルブリケータの末端から [始動装置モーター筐体カバー] 上の 3/8 インチ管のタップ付きの穴に 1/4 インチホースを再組付けします。

3. HDL2 の側面の 1/8 インチ NPTF 注油口から圧力の掛かっていない燃料ライン、ディーゼル燃料タンクまたは別の油容器に No. 6 ホースを再組付けします。ルブリケータの取り付け金具を 15 ～ 36 ft-lb (20.3 ～ 48.8 Nm) のトルクで締め付けます。重要：この接続は、真空気密にする必要があります。取り付け金具上のネジは清浄である必要があり、シーリング材または Teflon®® テープを使用せずに取り付け金具を組み立てます。

注意：初期運転の前に、手動で油供給ラインを油で満たします。

4. 別の lubrication 容器を使用する場合、この容器をディーゼル燃料、または SAE10 または 10W の薄い、非洗浄性のモーターオイルで満たします。

Disassembly of the Starter

General Information
1. Always mark adjacent parts on the Motor Housing Cover (1), Cylinder Housing (9), Gear Case (23) and Drive Housing (48) so these members can be located in the same relative position when the Starter is reassembled.
2. Do not disassemble the Starter any further than necessary to replace a worn or damaged part.
3. Do not remove any part which is a press fit in or on a subassembly unless the removal of that part is necessary for replacement or repairs.
4. Always have a complete set of vanes, seals and O-rings on hand before starting any overhaul of a Starter. Never reuse old seals or O-rings.
5. When grasping a part in a vise, always use leather covered or copper-covered vise jaws to protect the surface of the part and help prevent distortion. This is particularly true of threaded members.

Disassembly of the Drive Housing
1. With the Starter in a horizontal position and supported on the workbench, grasp the Drive Pinion (46) in copper covered vise jaws.

Do not use excessive clamping force on the Drive Pinion. Grasp it just firmly enough to hold it. Make certain the Starter is firmly supported on the workbench.
2. Using an 8 mm hexagon wrench, remove the Drive Pinion Retaining Screw (47).
3. Loosen the vise and withdraw the Drive Pinion from the Drive Shaft (41).
4. Stand the Starter on end with the Drive Shaft upward.
5. Using a 6 mm hexagon wrench, remove the four Drive Housing Cap Screws (54).

When unscrewing the Drive Housing Cap Screws, hold the Drive Housing (48) down against the expansion of the Piston Return Spring (39).
6. Lift off the Drive Housing.

Notice
The Gear Case (23) might come off with the Drive Housing. Separate the two if this occurs.
7. Do not remove the Drive Housing Bearing (50) or Drive Housing Seal (49) from the Drive Housing unless it is absolutely necessary, and you have a new Drive Housing Bearing and Seal on hand for replacement. These members are always damaged in the removal process. If it is necessary to remove the Drive Housing Bearing or Seal, stand the Drive Housing on the workbench with the seal end up. Drive or press the Seal and Bearing from the Drive Housing.

Disassembly of the Piston and Clutch
1. With the Starter standing on end as in Step 4 of the preceding section, lift off the Return Spring Seat (40) and Piston Return Spring (39).
2. Grasp the Piston (31) and slide the Piston, Clutch Jaws (35) and Drive Shaft (41) as a unit from the Gear Case (23).
3. Using a small, thin-bladed screwdriver, remove the Piston Bearing Retaining Ring (34) from the groove inside the Piston.
4. Slide the Piston off the Piston Bearing (33).
5. Remove the Piston O-ring (32) from the Piston.
6. Using a pair of snap ring pliers, remove the Clutch Jaw Retaining Ring (36) from the rear Clutch Jaw.
7. Press the Piston Bearing from the rear Clutch Jaw.
8. Grasp the Drive Pinion in copper-covered vise jaws so that the three driving lugs are upward.
9. While engaging the lugs on the Drive Shaft with those on the Drive Pinion, use an 8 mm hexagon wrench to unscrew the Drive Shaft Cap Screw (44). Remove the Drive Shaft Cap Screw, Washer (43) and Spacer (42).
10. Pull the rear Clutch Jaw from the Drive Shaft.

Do not remove the needle bearing from inside the rear Clutch Jaw unless a new needle bearing is available and ready to install. This bearing will be damaged in the removal process.
11. Slide the front Clutch Jaw, Clutch Spring (37) and Clutch Spring Cap (38) from the Drive Shaft.

Disassembly of the Gear Case
1. Pull the Gear Case (23) along with the Drive Gear (25) and its associated parts, from the motor.
2. Remove the Gear Case O-ring (24).
3. Using a pair of retaining ring pliers, remove the Bearing Retaining Ring (27).
4. Slide the Drive Gear from the bore of the Drive Gear Bearings (26) and Gear Case.

Note: It is possible that the rear Drive Gear Bearing will remain on the shaft of the Drive Gear.
5. Slide the Drive Gear Bearings from the bore of the Gear Case and/or from the shaft of the Drive Gear.
6. DO not remove the Gear Case Seal (28) from the bore of the Gear Case unless you have a new Seal on hand ready for installation. If it is necessary to remove the Gear Case Seal, use a small, thin-bladed screwdriver and remove the Gear Case Seal Retaining Ring (29) from each side of the Gear Case Seal.
7. Press the Gear Case Seal from the Gear Case.

Disassembly of the Motor
1. With the motor in a vertical position, Motor Housing Cover (1) upward, grasp the Cylinder Housing (9) in copper covered vise jaws.

Do not use excessive clamping force on the Cylinder Housing. Grasp it just firmly enough to support the motor.
2. Using a 6 mm hexagon wrench, remove the four Motor Housing Cover Cap Screws (5) and remove the Motor Housing Cover.
3. Lift the Retaining Nut Cover (17) from the Rear End Plate (7).
4. Using a 3 mm hexagon wrench, loosen the clamping screw in the Rear Rotor Bearing Retaining Nut (16).
5. Unscrew the Rear Rotor Bearing Retaining Nut.
6. Lay the motor on its side, and grasp the Rotor Pinion in copper-covered vise jaws.
7. Using an 8 mm hexagon wrench, unscrew the Rotor Pinion Retaining Screw (22).
8. Pull the Rotor Pinion from the Front Rotor Bearing (18).
9. Thread the Rotor Pinion Retaining Screw back into the front of the Rotor (13) about five or six turns.
10. Lay the motor on its side and, with a soft face hammer, tap the head of the Pinion Retaining Screw to drive the Rotor and Rear End Plate (7) from the opposite end of the Cylinder Housing (9).

The Rear Rotor Bearing (7A) is bonded to the Rear End Plate (7) with Loctite®. Removal of the Rotor Bearing requires the use of heat. Observe all normal precautions for the handling of hot material.
1. To install the Rear Rotor Bearing (7A) in the Rear End Plate (7), apply a small amount of Loctite 680** or equivalent and activate to the outside of the outer race of the Rear Rotor Bearing.
2. Install the Bearing in the recess in the Rear End Plate and allow Loctite to cure for 8-10 hours.
3. Place the Rotor (13) on an arbor press with the three-jaw drive end down.
4. Set the Rear End Plate (7) flat side down, on the upper end of the Rotor.
5. Place two pieces of .004" (0.10 mm) thick shim stock in opposite positions on the end of the Rotor under the end plate.
6. Using a hollow arbor that seats against the inner race of the bearing, press the Rear End Plate down against the shim stock.
7. Remove the Rear End Plate from the arbor press and grasp the Rotor in copper covered vise jaws with the threaded hub upward.
8. Start the Rear Rotor Bearing Retaining Nut (16), shoulder side first, on the hub of the Rotor.
9. Adjust the Rear Rotor Bearing Retaining Nut until there is a slight drag on the shim stock. Remove the shim stock. Using a 3 mm hexagon wrench, tighten the clamping screw in the Retaining Nut to 10 in-lb (1.1 Nm) torque.
10. Remove the assembled Rotor and Rear End Plate from the arbor, or installing the bearing wrong end first, may fracture the shell or lock the needles against rotation.
11. Take one of the End Plate O-rings (8) and coat it liberally with O-ring lubricant. Set the End Plate O-ring down over the Rotor into the groove in the Rear End Plate. Make certain the entire O-ring is in the groove and that it has sufficient O-ring lubricant on it to hold it in the groove.
12. Check the Cylinder Dowels (10) pressed into each end of the Cylinder Housing (9). If the Dowels are bent or broken, remove them and install new Cylinder Dowels!
13. Set the Cylinder Housing on end on two pieces of wood at least 3/4" (19 mm) thick, so that when the Rotor is installed there is clearance for the driving lugs on the hub to extend beyond the face of the Cylinder Housing.
14. Take the assembled Rear End Plate and Rotor and insert the Rotor end down through the Cylinder Housing so that the Cylinder Dowels are aligned with the dowel holes in the Rear End Plate.

** NOTICE **

Do not get any Loctite in the bearing; damage to the Bearing could result. Do not get any on the inside diameters of the Bearing; grease will prevent the Loctite from working.

* Registered trademark of Loctite Corporation.

NOTICE

Discard any grease seal that was removed during disassembly of the Starter.

3. Check the needle bearing in the rear Clutch Jaw. If the bearing is worn, distorted or has loose needles, replace the two piece Clutch Jaw.

NOTICE

The clutch jaws are a matched set and must be replaced with a matched set.

4. Check all ball bearings- These should run freely without any rough spots or binding- Discard any bearing that gives any indication of wear.
5. Check the Vanes for separation, chipping or other wear. See that they fit freely in the vane slots in the Rotor. We recommend that a complete new set of Vanes be installed whenever the Starter is disassembled.

* Registered trademark of Loctite Corporation.

NOTICE

Check the model number of the Starter to determine the direction of rotation. Model numbers having the letter “R” are right-hand rotation; model numbers having the letter “L” are left-hand rotation.

For right-hand rotation Models: Stand the Cylinder Housing on end on the two pieces of wood so that the pipe tapped exhaust port is facing you, and so that the kidney-shaped air port is on the left side of the Cylinder Housing. For left-hand rotation Models: Stand the Cylinder Housing on end on the two pieces of wood so that the pipe tapped exhaust port is facing you, and so that the kidney-shaped air port is on the right side of the Cylinder Housing.

14. Take the assembled Rear End Plate and Rotor and insert the Rotor down through the Cylinder Housing so that the Cylinder Dowels are aligned with the dowel holes in the Rear End Plate.

Assembly of the Starter

General Instructions

1. Always press on the inner ring of a ball bearing when pressing that bearing onto a shaft. Always press against the outer ring of a ball bearing when pressing that bearing into a bearing recess. Failure to follow these instructions may ruin the bearing.
2. When pressing a needle bearing into a bearing recess, always press against the stamped end of the bearing using a piloted arbor that contacts only the outer rim of the shell. The use of a flat arbor that seats against the inner race of the bearing, press the Rear End Plate down against the shim stock. The clearance between the Rear End Plate and the Rotor can be

3. Check the needle bearing in the rear Clutch Jaw. If the bearing is worn, distorted or has loose needles, replace the two piece Clutch Jaw.

INSPECTION OF PARTS

1. Discard all O-rings and gaskets. These should not be reused.
2. Check all grease seals and replace any which are worn or distorted.

Cleaning the Parts

Once the Starter has been disassembled, clean all parts for inspection.

1. Wipe all dirt, grease, etc., from the sealed bearings. Do not wash these parts in kerosene or other solvent, as this will dilute and contaminate any sealed-in lifetime lubricant.
2. Wash all parts except the sealed bearings in clean kerosene or other solvent. Dry the parts with compressed air.

Assembly of the Motor

1. Wipe all dirt, grease, etc., from the sealed bearings. Do not wash these parts in kerosene or other solvent, as this will dilute and contaminate any sealed-in lifetime lubricant.
2. Check all ball bearings- These should run freely without any rough spots or binding- Discard any bearing that gives any indication of wear.
3. Check the Vanes for separation, chipping or other wear. See that they fit freely in the vane slots in the Rotor. We recommend that a complete new set of Vanes be installed whenever the Starter is disassembled.

* Registered trademark of Loctite Corporation.

Assembly of the Motor

1. Wipe all dirt, grease, etc., from the sealed bearings. Do not wash these parts in kerosene or other solvent, as this will dilute and contaminate any sealed-in lifetime lubricant.
2. Check all ball bearings- These should run freely without any rough spots or binding- Discard any bearing that gives any indication of wear.
3. Check the Vanes for separation, chipping or other wear. See that they fit freely in the vane slots in the Rotor. We recommend that a complete new set of Vanes be installed whenever the Starter is disassembled.

* Registered trademark of Loctite Corporation.

NOTICE

The clearance between the Rear End Plate and the Rotor can be from .002" (0.05 mm) to .005" (0.13 mm) after tightening the clamping screw.

10. Remove the assembled Rotor and Rear End Plate from the arbor and stand them upright on the workbench with the Rotor upward.
11. Take one of the End Plate O-rings (8) and coat it liberally with O-ring lubricant. Set the End Plate O-ring down over the Rotor into the groove in the Rear End Plate. Make certain the entire O-ring is in the groove and that it has sufficient O-ring lubricant on it to hold it in the groove.
12. Check the Cylinder Dowels (10) pressed into each end of the Cylinder Housing (9). If the Dowels are bent or broken, remove them and install new Cylinder Dowels!
13. Set the Cylinder Housing on end on two pieces of wood at least 3/4" (19 mm) thick, so that when the Rotor is installed there is clearance for the driving lugs on the hub to extend beyond the face of the Cylinder Housing.

Notice

Check the model number of the Starter to determine the direction of rotation. Model numbers having the letter “R” are right-hand rotation; model numbers having the letter “L” are left-hand rotation.

For right-hand rotation Models: Stand the Cylinder Housing on end on the two pieces of wood so that the pipe tapped exhaust port is facing you, and so that the kidney-shaped air port is on the left side of the Cylinder Housing. For left-hand rotation Models: Stand the Cylinder Housing on end on the two pieces of wood so that the pipe tapped exhaust port is facing you, and so that the kidney-shaped air port is on the right side of the Cylinder Housing.

14. Take the assembled Rear End Plate and Rotor and insert the Rotor down through the Cylinder Housing so that the Cylinder Dowels are aligned with the dowel holes in the Rear End Plate.
15. Tap the Rear End Plate into place so that it seats against the face of the Cylinder Housing. Make certain the End Plate O-ring does not come out of the groove in the End Plate.

16. Fit the Retaining Nut Cover (17) on the hub of the Rear End Plate.

17. Coat a second End Plate O-ring (8) with O-ring lubricant and place it in the groove in the trailing face of the Rear End Plate.

Make certain the entire O-ring is in the groove.

18. Place the Motor Housing Cover (1) on the Rear End Plate, making certain that it is oriented relative to the exhaust port in the Cylinder Housing, exactly the way it was prior to disassembly.

19. Using a 6 mm hexagon wrench, install the four Motor Housing Cover Cap Screws (5) and tighten them to 20 ft-lb (27 Nm) of torque.

20. Install the two 3/8” Pipe Plugs (2) in the Motor Housing Cover and tighten them securely.

21. Turn the motor end-for-end so that the front hub of the Rotor is upward.

22. Wipe each Vane (20) with a film of light oil and install a Vane in each vane slot in the Motor. Make certain the tapered edge of each Vane faces the center of the Rotor.

23. Coat an End Plate O-ring (12) with a liberal amount of O-ring lubricant and place it in the groove on the flat side of the Front End Plate (11). Make certain the entire O-ring is in the groove and that there is a sufficient amount of lubricant to hold it in place.

24. Place the Front End Plate, flat side first, down over the hub of the Rotor so that the Cylinder Dowels are aligned with the dowel holes in the End Plate.

25. Tap the Front End Plate with a soft face hammer until it seats against the Cylinder Housing. Make certain the End Plate O-ring does not slip out of the groove in the End Plate.

26. Place the two Front Rotor Bearing Wave Washers (19) in the bottom of the bearing recess in the Front End Plate.

27. Install the Front Rotor Bearing (18) in the bearing recess in the Front End Plate.

28. Place the Rotor Pinion (21), lug side first, in the bore of the Front Rotor Bearing so that it engages: the lugs on the end of the rotor shaft.

**NOTICE**

Check to make sure the lugs are engaged.

29. Using an 8 mm hexagon wrench, install the Rotor Pinion Retaining Screw (22) and tighten it to 55 ft-lb (74 Nm) of torque.

**Assembly of the Gear Case**

1. Stand the Gear Case (23), large open end up, on the workbench.

2. Install a Gear Case Seal Retaining Ring (29) in the first or upper groove in the small diameter end of the Gear Case.

3. Place the Gear Case on an arbor press, large end down. Press the Gear Case Seal (28), lip side first, into the small bore of the Gear Case until it seats against the Retaining Ring.

4. Install the second Gear Case Seal Retaining Ring in the second groove in the small bore of the Gear Case.

5. Slide a Drive Gear Bearing (26) on the hub of the Drive Gear (25) until it seats.

6. Wipe a thin film of O-ring lubricant on the lip of the Gear Case Seal and on the shaft of the Drive Gear.

7. Insert the shaft of the Drive Gear into the large open end of the Gear Case and through the Gear Case Grease Seal. Make certain that the lip of the Grease Seal does not turn inside out or that the garter spring does not come off. Push the Drive Gear into the Gear Case until it engages the Gear Case Retaining Ring.

8. Slide the second Drive Gear Bearing into the small end of the Gear Case until it seats against the second Gear Case Seal Retaining Ring.

9. Using a pair of retaining ring pliers, install the Bearing Retaining Ring (27) in the groove on the hub of the Drive Gear.

10. Coat the Gear Case O-ring (24) with O-ring lubricant and install it in the groove on the hub of the Gear Case.

**Assembly of the Piston and Drive Shaft**

1. Grasp the Drive Pinion (46) in copper-covered vise jaws so that the lugs on the Drive Pinion are upward.

**CAUTION**

Do not use excessive clamping force on the Drive Pinion. Grasp it just firmly enough to hold it.

2. Stand the Drive Shaft (41) on end so that the lugs on the large end of the Drive Shaft engage the lugs on the Drive Pinion. Install the Drive Pinion Retaining Screw (47) and tighten finger tight.

3. Lubricate the spline on the Drive Shaft with Ingersoll Rand Grease No. 130.

4. Slide the Clutch Spring Cup (38), small end first, over the splined end of the Drive Shaft until it seats against the shoulder on the Drive Shaft.

5. Slide the Clutch Spring (37) over the splined end of the Drive Shaft and into the Clutch Spring Cup.

**CAUTION**

Make certain you install the correct Clutch Spring. Clutch Springs for Starters having the letter “L” in the Model number are color coded “red.” Clutch Springs for Starters having the letter “R” in the Model number have a natural metallic finish.

6. Work some Ingersoll Rand Grease No. 130 in the splines and teeth of the front Clutch Jaw (35), and slide the front Clutch Jaw, small diameter end first, over the splines on the Drive Shaft and against the Clutch Spring.

7. Slide the Needle Bearing (30) over the end of the Drive Shaft.

8. Press the Piston Bearing (33) on the shaft of the rear Clutch Jaw (35), and install the Clutch Jaw Retaining Ring (36).

9. Work some Ingersoll Rand Grease No. 130 into the Needle Bearing inside the rear Clutch Jaw and on the teeth of the rear Clutch Jaw.

10. Place the rear Clutch Jaw, teeth end first, on the end of the Drive Shaft so that the teeth of both Clutch Jaws are engaged.

11. Make certain the splines on the front Clutch Jaw are engaged with the splines on the Drive Shaft by pushing the rear Clutch Jaw downward against the compression of the Clutch Spring. While holding the assembly in this position, drop the Drive Shaft Spacer (42) into the bore of the rear Clutch Jaw, followed by the Drive Shaft Washer (43).

12. Using an 8 mm hexagon wrench, install the Drive Shaft Cap Screw (44) and tighten it to 55 ft-lb (74 Nm) of torque.

13. Work the rear Clutch Jaw back and forth against the compression of the Clutch Spring to make certain that it moves freely and travels 15/32” (12 mm). When the Clutch Jaw is pressed down against the Clutch Spring and released, it must return freely. Remove the Drive Pinion Retaining Screw and Drive Pinion.

14. Take the assembled Clutch Jaw and Drive Shaft and insert it, splined end first, into the large diameter bore of the Piston (31) until the Piston Bearing is seated.

15. Install the Piston Bearing Retaining Ring (34) in the groove on the Piston.

16. Coat the Piston O-ring (32) with O-ring lubricant and install it in the groove on the Piston.

**Assembly of the Drive Housing**

1. Stand the Drive Housing (48) on an arbor press with the large open bore upward. Press the Drive Housing Seal (49), lip side first, into the recess at the bottom of the housing bore.

2. Using a sleeve that contacts the outer race of the Drive Housing Bearing (50), press the Bearing into the bearing recess at the bottom of the housing bore until it seats.

28
Assembly of the Starter

1. Grasp the assembled motor in a large vise so that the Rotor Pinion (21) is upward.

**CAUTION**
Do not use excessive clamping force on the Drive Pinion. Grasp it just firmly enough to hold it.

2. Liberally coat an End Plate O-ring (12) with O-ring lubricant, and place it in the groove on the face of the Front End Plate (11). Make certain the entire O-ring is in the groove.

3. Work approximately 150 cc of Ingersoll Rand Grease No. 130 into the teeth on the Drive Gear (25) and Rotor Pinion (21).

4. Orient the Gear Case (23) exactly the way it was prior to disassembly of the Starter, and place it on the face of the motor so that the Rotor Pinion meshes with the Drive Gear. Make certain the End Plate O-ring stays in the groove on the face of the Front End Plate.

5. Place the Drive Housing Gasket (53) on the face of the Gear Case, making certain all holes are properly aligned.

6. Lubricate the internal splines of the Drive Gear and the hub of the Gear Case adjacent to the Gear Case O-ring (24) with Ingersoll Rand Grease No. 130.

7. Place the assembled Clutch Jaw (35), Drive Shaft (41) and Piston (31) over the hub of the Gear Case so that the splines on the Clutch Jaw engage the internal splines of the Drive Gear, and so that the piston skirt slides down over the hub of the Gear Case until it seats.

8. Wipe a film of Ingersoll Rand Grease No. 130 on the exterior of the Drive Shaft, Piston and Piston Return Spring (39).

9. Place the Piston Return Spring over the end of the Drive Shaft so that it seats against the Piston Bearing Retaining Ring (34) in the front of the Piston. Place the Return Spring Seat (40) on the end of the Piston Return Spring so that the small lip on the Seat fits inside the Return Spring.

10. Liberally coat the Drive Housing O-ring (51) with O-ring lubricant, and install the O-ring in the counterbore at the base of the Drive Housing (48).

11. Liberally coat the bore of the Drive Housing with Ingersoll Rand Grease No. 130.

12. Making certain that the Drive Housing O-ring stays in place, place the Drive Housing down over the Piston Return Spring and Piston until it seats against the Gear Case and is oriented exactly the way it was prior to disassembly.

13. Using a 6 mm hexagon wrench, install the four Drive Housing Cap Screws (54) in the holes in the flange of the Drive Housing. Tighten the Drive Housing Cap Screws to 20 ft-lb (27 Nm) of torque.

14. Place the Drive Shaft Collar (45) over the lugs on the end of the Drive Shaft. If necessary, tap it into place with a plastic hammer.

15. Place the Drive Pinion (46) on the end of the Drive Shaft so that the lugs on the Piston engage those on the Shaft.

16. Insert the Drive Pinion Cap Screw (47) through the Drive Pinion and thread it into the Drive Shaft.

17. Place the Starter in a horizontal position so that it is supported on the workbench. Grasp the Drive Pinion in copper-covered vise jaws and, using an 8 mm hexagon wrench, tighten the Drive Pinion Retaining Screw to 55 ft-lb (74 Nm) of torque.

Testing the Starter

1. Turn the Drive Pinion (46) by hand in the direction of Starter rotation. The clutch should ratchet smoothly with a slight “clicking” action.

**NOTICE**
Proper Starter rotation is indicated when facing the Drive Pinion. That is, a Starter having the letter “R” in the model number is designated as a right-hand rotation model, and the Drive pinion will rotate clockwise when facing the Drive Pinion.

2. Turn the Drive Pinion in the opposite direction of Starter rotation. The gearing and motor should rotate freely with no binding.

3. Attach an air hose to the “IN” port on the Drive Housing (48), and apply 50 psig (3.4 bar/345 kPa) air pressure. The Drive Pinion should move outward and air should escape from the “OUT” port.

4. Plug the “OUT” port and apply 150 psig (10.3 bar/1034 kPa) air pressure to the “IN” port. Check to make certain no air is escaping. Measure the distance from the face of the Drive Pinion farthest from the mounting flange to the machined face of the mounting flange. It should be 2.75” (70.0 mm ± 1.5 mm). With the air pressure on and the Drive Shaft extended, push the Drive Pinion toward the Drive Housing until the Pinion rotates slightly and comes to a solid stop. While holding the Drive Pinion against the stop, measure again the distance from the face of the Drive Pinion to the machined face of the mounting flange. The difference between the two measurements must be 0.47” (12.0 mm ± 0.9 mm). Remove the pressure from the “IN” port and measure again the distance from the face of the Drive Pinion to the machined face of the mounting flange. It should be 1.82” (46.2 mm ± 1.5 mm).

5. Attach a 3/8” (9 mm) air hose to the inlet of the motor and apply 90 psig (6.2 bar/620 kPa) air pressure. The Starter motor should run smoothly.

6. Plug the exhaust port and apply 30 psig (2.1 bar/207 kPa) air pressure to the inlet of the motor. Immerse the Starter for thirty seconds in a nonflammable solvent. If the Starter is properly sealed, no bubbles will appear.
## Troubleshooting Guide

<table>
<thead>
<tr>
<th>Trouble</th>
<th>Probable Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loss of Power</td>
<td>Worn Motor Parts</td>
<td>Remove the motor from the Motor Housing (9) and disassemble the motor. Examine all parts and replace any that are worn or damaged. Use the following guidelines for determining unserviceable parts:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Vanes (20) - Install a set of new vanes if any vane is separated, cracked, spalled or worn to the extent that its width is 0.67” (17 mm) or less at either end.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Rotor Bearing (7A) or (18) - Replace if any roughness or looseness is apparent.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Rotor (13) - Replace if the body has deep scoring that cannot be removed by polishing with emery cloth.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4. Cylinder Housing (9) - Replace if there are any cracks or deep scoring.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>5. End Plates (7 or 11) - Clean up scoring by rubbing it with emery cloth placed on a flat surface.</td>
</tr>
<tr>
<td>Inadequate Lubrication</td>
<td></td>
<td>Check the Lubricator, inlet hose, fitting and oil supply hose to make sure they are vacuum tight and free of leaks. Tighten all joints and replace the Lubricator if necessary.</td>
</tr>
<tr>
<td>Air or Gas Leakage</td>
<td>Worn O-rings</td>
<td>Check the End Plate O-rings (8 or 12) and Drive Housing O-ring (51). Plug the exhaust. Apply 30 psig (2.1 bar/207 kPa) air to the inlet and Immerse the unit for 30 seconds in nonflammable solvent. If bubbles appear, replace the O-ring, Gaskets or Seals.</td>
</tr>
<tr>
<td>Pinion does not engage the flywheel</td>
<td>Broken clutch jaws or other broken parts</td>
<td>Refer to Disassembly of the Piston and clutch.</td>
</tr>
<tr>
<td>Motor runs, pinion engages but does not rotate</td>
<td>Broken Shafting, Gearing or Clutch Jaws</td>
<td>Refer to Disassembly of the Piston and clutch.</td>
</tr>
<tr>
<td>Excessive butt engagements</td>
<td>Dry helical spline</td>
<td>Refer to Disassembly of the Piston and Clutch. Lubricate the helical spline with Ingersoll Rand Grease No. 130.</td>

## Parts and Maintenance

**NOTICE**

The use of other than genuine Ingersoll Rand replacement parts may result in safety hazards, decreased Starter performance, and increased maintenance, and may invalidate all warranties. Ingersoll Rand is not responsible for customer modification of Starters for applications on which Ingersoll Rand was not consulted. Repairs should be made only by authorized trained personnel. Consult your nearest Ingersoll Rand Authorized Service center.

Manuals can be downloaded from www.irtools.com.

Refer all communications to the nearest Ingersoll Rand Office or Distributor.
